PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A Request for Continued Examination under 37 CFR § 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR § 1.114, and the fee set forth in 37 CFR § 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR § 1.114. Applicant's submission filed on February 9, 2009, has been entered.

Claims 28, 29, 34-36 and 41-59, are pending in the instant application; claims 42, 44-51 and 53-59 are withdrawn as being directed to a non-elected invention; claims 28, 29, 34-36, 41, 43 and 52, are the subject of the Office Action below.

Claim Rejections - 35 USC § 112, second paragraph

The following is a quotation of the second paragraph of 35 U.S.C. § 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 28, 29, 34-36, 41, 43 and 52 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 28 and 35 are indefinite for reciting the claimed substitution because one of ordinary skill in the art could not reasonably determine the metes and bounds of this limitation. For example, the claim appears to be directed to oligonucleotides that “correspond to” certain positions of SEQ ID NO:12; it is not clear how this limitation would be interpreted in light of a DNA sequence with 95% similarity, but had a frame deletion at position 100, and also had a mutation at position 222.

The fact that Applicants have added the reference to Table 1 does not provide clarity. In fact, it is not questionable whether the claim is now limited to only the sequences of Table 1.

Claim Rejections - 35 USC § 112, first paragraph

The following is a quotation of the first paragraph of 35 U.S.C. 112:

Art Unit: 1639

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

There are many factors to be considered when determining whether there is sufficient evidence to support a determination that a disclosure does not satisfy the enablement requirement and whether any necessary experimentation is "undue." *In re Wands*, 858 F.2d 731, 737, 8 USPQ2d 1400, 1404 (Fed. Cir. 1988). These factors include, but are not limited to:

- (A) The breadth of the claims;
- (B) The nature of the invention;
- (C) The state of the prior art;
- (D) The level of one of ordinary skill;
- (E) The level of predictability in the art;
- (F) The amount of direction provided by the inventor;
- (G) The existence of working examples; and
- (H) The quantity of experimentation needed to make or use the invention based on the content of the disclosure.

Claims 28, 29, 34-36, 41, 43 and 52 are not enabled:

Claims 28, 29, 34-36, 41, 43 and 52, are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for transforming the plastome of a tobacco plant with the specifically claimed mutations at position 226 of SEQ ID NO:12, does not reasonably provide enablement for any plant. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to use the invention commensurate in scope with these claims.

Applicants allege that the rejection is improper because the Examiner has not made a *prima facie* case that Applicants' invention was not enabled (page 8). Applicants allege that their invention is enabled for a wide range of monocot and dicot species (page 8, third paragraph), and generally discuss certain selectable markers (page 9, first paragraph). Applicants are of the opinion that the Lutz reference is over-interpreted and taken out of context (page 9, second paragraph), cites other U.S. Patents that support the patentability of the pending claims (page 9, third paragraph), and suggests that Kanevski is inapposite to the instant rejection.

Art Unit: 1639

Applicants arguments have been fully considered, but are not found persuasive. Although Applicants allege that their invention is enabled for a wide range of monocot and dicot plants, Applicants working examples have only been shown to work in tobacco plants.

The Examiner has provided a fact-based publication by Lutz that challenges that factual assertions made by Applicants. Lutz states that as of the year 1999, plastid transformation was only routine in tobacco, and that any advances in other plants were made through experimental gain, such as those that are listed:

“(Svab et al., 1990; Svab and Maliga, 1993), but has rapidly expanded to diverse crops including potato (*Solanum tuberosum*; Sidorov et al., **1999**), tomato (*Solanum lycopersicum*; Ruf et al., **2001**), lettuce (*Lactuca sativa*; Lelivelt et al., **2005**; Kanamoto et al., **2006**), soybean (*Glycine max*; Dufourmantel et al., **2004**), cotton (*Gossypium hirsutum*; Kumar et al., **2004**), cauliflower (*Brassica oleracea*; Nugent et al., **2006**), and poplar (*Populus alba*; Okumura et al., **2006**).”

Lutz, page 1201, first paragraph in col. 2.

Applicants do not respond with a declaration that from an expert nor provide any sound scientific basis as to why Lutz's comments should not be taken at face value. None of the references that make advances in plastid transformation including Sidorov, Ruf, Lelivelt, Kanamoto, Kumar, Nugent nor Okumura are discussed within the context of the art or the instant invention. Regarding Kanevski, Applicants appear to be of the opinion that the transformation issues at hand are inapposite because of the references teaching of going from sunflower to tobacco; there is no such a requirement in the claims, as the claims read on all plants and are not limited to tobacco as they should be.

Regarding the patentability of the claims in the '513 patent, '817 patent, the '818 patent and the '198 patent, these arguments are inapposite to the patentability of the instant claims.

Applicants also do not explain how the use of their markers is routine and how one of ordinary skill in the art would integrate such a teaching to arrive at a transformed plant other than tobacco. Therefore the rejection is maintained.

Reiterated Rejection:

Art Unit: 1639

The standard for determining whether the specification meets the enablement test was first stated in *Mineral Separation v. Hyde*, 242 U.S. 261, 270 (1916), and asks if the experimentation needed to practice the invention undue or unreasonable.

The claimed invention is enabled if any person skilled in the art can make and use the invention without undue experimentation. The focus is on ‘undue’ rather than on ‘experimentation’ (*In re Wands*, at 737, 8 USPQ2d at 1404; see also *United States v. Telectronics, Inc.*, 857 F.2d 778, 785, 8 USPQ2d 1217, 1223 (Fed. Cir. 1988)).

A patent need not teach what is well known in the art (*In re Buchner*, 929 F.2d 660, at 661, 18 USPQ2d 1331, at 1332 (Fed. Cir. 1991); *Hybritech, Inc. v. Monoclonal Antibodies, Inc.*, 802 F.2d 1367, 1384, at 231 USPQ 81, at 94 (Fed. Cir. 1986), cert. denied, 480 U.S. 947 (1987); *Lindemann Maschinenfabrik GMBH v. American Hoist & Derrick Co.*, 730 F.2d 1452, at 1463, 221 USPQ 481, at 489 (Fed. Cir. 1984)).

Determining whether claims are sufficiently enabled by the specification is based on underlying findings of fact. *In re Vaeck*, 947 F.2d 488, at 495, 20 USPQ2d 1438, at 1444 (Fed. Cir. 1991); *Atlas Powder Co. v. E.I. du Pont de Nemours & Co.*, 750 F.2d 1569, at 576, 224 USPQ 409, at 413 (Fed. Cir. 1984).

The Breadth of the Claims

The claims are overly broad because the claims encompass the genetic transformation of the plastids of all plants, wherein a chimeric gene comprising SEQ ID NO:12 having a 226 mutation of Ala → Thr, and a promoter capable of expressing the DNA molecule in a plastid to produce a mature enzyme in the plastid.

The Nature of the Invention, and the Level of One of Ordinary Skill

As it is with many inventions in the biotechnology arts, the art related to plant genetics and the genetic transformation of plants is multidisciplinary. Applicants’ claimed invention relates to a number of core technologies and scientific concepts including the selection of certain vectors, the required expression elements within the vector, and the chemistry and microbiology of gene delivery.

Art Unit: 1639

Those of skill in the art have a strong understanding of the inter-relationship between each of the core concepts, and understand where the specification lacks guidance that certain solutions are provided for in the art as routine.

The Amount of Guidance, and the Existence of Working Examples

In the *Background of the Invention*, Applicants summarize the importance of understanding biosynthetic pathways that lead to the production of chlorophyll and heme, the physiological importance of these proteins to plants, and the role that protox plays in the synthesis of these proteins (pages 1 and 2). Applicants also explain how it would be advantageous to develop a plant with a protox enzyme that is resistant to given herbicides through site directed mutagenesis, and expressing such an enzyme in the plastid (pages 2-6).

In the *Summary of the Invention* (pages 6-9), Applicants generally describe that the invention is directed towards genetically modified plants, wherein the plants have improved protox activity with reduced toxicity to herbicides, wherein the genetic modification is done at the plastome level. Applicants state that plants that would be useful for practice of the invention include barley, wheat, sorghum, rye, oats, turf and forest grasses, as well as sugar cane, cotton, soybean and tobacco (page 7, first paragraph).

In addition to providing certain definitions related to the invention (pages 11-15), the *Detailed Description of the Invention*, expands upon Applicants summary of the invention. This expanded description provides certain routine description of procedures related to plant genetics, and how such procedures should relate to the disclosed invention (pages 15-73).

Applicants provide a number of working examples, some of which are related to the claimed invention.

Examples 1-8 are directed to the isolation of various plant protox genes, such as wheat, soybean, cotton and others (pages 74-80). Examples 9-12 relate to protox clone testing regarding herbicides (pages 81-85). Examples 13-15 relate to certain protox mutants, and Example 16 relates to the mutant of SEQ ID NO:12 with the Ala → Thr mutation at position 226. Examples 17-19 are related to other mutant protox enzymes.

Examples 20-47 relate to certain gene-based transformation components of the invention, including certain vectors and components such as promoters, but do not exemplify a working

Art Unit: 1639

example of a plant having a genetically modified plastome that expresses a mutant protox in a plastid other than a tobacco plant.

The State of the Prior Art and the Level of Predictability in the Art

At the time that the invention was filed (the priority date for claim 28 is February 28, 1997), there existed a number of challenges for genetically modifying the plastome in plants other than the tobacco plant. For example, Lutz (Lutz *et al.*, Plant Physiology 145:1201-1210, 2007) teaches that transformation of a plant on the plastome level was only routine for tobacco plants:

“For example, a typical Arabidopsis leaf cell contains approximately 120 chloroplasts and a total of 1,000 to 1,700 ptDNA copies (Zoschke *et al.*, 2007) while an average tobacco (*Nicotiana tabacum*) leaf cell carries approximately 100 chloroplasts and approximately 10,000 ptDNA copies (Shaver *et al.*, 2006). Transformation of the nuclear genome is routine in higher plants and is reviewed in this Focus Issue of Plant Physiology. Plastid ***transformation is routine only in tobacco*** (Svab *et al.*, 1990; Svab and Maliga, 1993), but has rapidly expanded to diverse crops including potato (*Solanum tuberosum*; Sidorov *et al.*, 1999), tomato (*Solanum lycopersicum*; Ruf *et al.*, 2001), lettuce (*Lactuca sativa*; Lelivelt *et al.*, 2005; Kanamoto *et al.*, 2006), soybean (*Glycine max*; Dufourmantel *et al.*, 2004), cotton (*Gossypium hirsutum*; Kumar *et al.*, 2004), cauliflower (*Brassica oleracea*; Nugent *et al.*, 2006), and poplar (*Populus alba*; Okumura *et al.*, 2006). Transformation of mitochondrial DNA remains a challenge for the future.”

Lutz, page 1201, first paragraph in col. 2 (emphasis added).

Certain specific aspects as to why genetically modifying the plastome requires undue experimentation are explained by Kanevski (Kanevski *et al.*, Plant Physiology, January 1999, Vol. 119, pp. 133–141). Kanevski teaches the transformation of a sunflower plant at the plastome level based on an understanding of the tobacco plant, but shows how technical obstacles arise to a successful transformation, and include factors such as incompatibility at the level of translation, or protein folding:

“This is followed by transformation of the plant system to express the chimeric genes and produce protein. The full gene from *Synechococcus* PCC6301 was transcribed into mRNA, but the mRNA was not translated into protein. ***At this stage, it is unknown whether there is incompatibility***

Art Unit: 1639

at the level of translation, or if the protein, once produced, is unable to assemble correctly using the indigenous folding machinery. Western analysis indicated that if protein is produced it is transient and does not accumulate enough to be detected by antibodies raised against the cyanobacterial large subunit. However, in those cases in which higher plant/cyanobacterial rbcL chimeras are of interest (Gutteridge et al., 1989a) and have proved intractable using E. coli expression and refolding, this system might provide an alternative approach, one that can supply the amounts of enzyme required for detailed structural analysis using crystallography.”

Kanevski, page 139, first paragraph in col. 1 (emphasis added).

The Quantity of Experimentation

Based on the art cited above, the unresolved issues in the relevant art pertaining to the genetic transformation of a non-tobacco plastome, the amount of non-routine experimentation required would be high. Accordingly, in order to enable the invention as claimed, one of ordinary skill in the art would have to resort to undue experimentation.

Conclusions

No claim is allowable.

If Applicants should amend the claims, a complete and responsive reply will clearly identify where support can be found in the disclosure for each amendment. Applicants should point to the page and line numbers of the application corresponding to each amendment, and provide any statements that might help to identify support for the claimed invention (*e.g.*, if the amendment is not supported *in ipsius verbis*, clarification on the record may be helpful). Should Applicants present new claims, Applicants should clearly identify where support can be found in the disclosure.
